4.16) Logout 50

1) Software Requirement Specification (SRS) document

1.1) Introduction:

Pharmacy Management System is a system that helps a pharmacist to manage his pharmacy at many levels of management, he can handle the medicines in his pharmacy and register information about them like (name, selling price, supplier company... etc.),

and keep track of their status like if a medicine is available or not, the available quantity of some medicine and the alternatives of medicine, he can also update the information of medicine and for sure he can draw an amount of medicine, the system also makes the pharmacist handles other users information in case other people works with him in the pharmacy so he can add users to the system, delete them and register information about them, the system also handles the supplier companies and save their information and their contacts, A simple GUI is provided so that the user can deal with the system easily.

1.2) Feasibility analysis:

• Technical aspects:

Tool Factor:

The tools and technologies required to build the system are:

- QT Creator
- SQLite
- MS VISIO
- Draw.io

Each of these technologies are available free of charge

Knowledge and skills Factor:

The team has the required skills to use these tools and to carry out the project

Time-limitations of the development of the system and the ease of implementation by

using these technologies are synchronized.

By this analysis we find that the project is technically feasible

• Resource Feasibility

The Resources required for the project includes:

- Programming devices (Laptops)
- Working space (freely available)
- Programming tools (freely available)
- Software engineers (available)

By this analysis we find that the project has the resource feasibility

• Social/Legal Feasibility

The project uses freely available tools in the development and the software libraries used in this system are free open-source libraries.

So by the above analysis we can say that this system is feasible

1.3) System Requirements

Functional Requirements:

1. An admin can create his own account using an email and a password.
2. The admin can manipulate users' accounts so he can add, update, or delete users account from the system and their information and salary.
3. An admin can add supplying companies' names, contacts, and their address.
4. A user can register a medicine with its details which are its name, selling price, available quantity, the supplier company of that medicine, the purchasing price from the supplier and the medicine's expiry date.
5. The user can check if some medicine is available or not.

6. The program should enable the user to check the price of some medicine.
7. The Program should Show the names of some medicine's alternatives.
8. System should enable the user to check if there is a shortage in some medicines and show the contacts of the supplier company to help him make a new order from them.

Non-Functional Requirements:

- **Product requirements:**

The system must be delivered within 2 months, occupy no more than 25 MB of memory, and be supported with a GUI that is easy to use.

- **Organizational requirements:**

The project must be written in C++ and the GUI must be by QT creator, it must be made using DB with SQLite browser, System should conform to IEEE and ISO standards.

- **External requirements:**

The system should conform to all applicable local and international laws.

1.4) Requirements Validation

Source Traceability Matrix:

	1	2	3	4	5	6	7	8
Admin	✓	✓	✓	✓	✓	✓	✓	✓
User				✓	✓	✓	✓	✓

Requirements Traceability Matrix:

Req. no	1	2	3	4	5	6	7	8
1								
2	D							
3	D							
4	D	D	P					
5				D				
6				D				
7					D			
8			P	D	D			

Notations: **D** → Dependent, **P** → Partially dependent

Assumptions:

- 1) Req 2 needs the admin to login (in Req 1) to add new users.
- 2) Req 3 needs (in Req 1) the admin to login to be able to add supplier companies' info such as names, contacts and addresses.
- 3) Req 4 needs the admin or the users to login (in Req 1 & 2) to be able to register medicines info including the supplier companies' contacts (in Req 3).

- 4) Req 5 needs to check the available quantity of the required medicine (in Req 4).
- 5) In Req 6, the user needs to check the price of the ordered medicine (in Req 4).
- 6) In Req 7, first it's needed to know if the required medicine is available or not (in Req 5).
- 7) In Req 8, it's needed to check if there is shortage in the quantities of the medicines in the stock (in Req 4) or if there is already some medicines that ran out from the stock (in Req 5), in such case the supplier companies' contacts of these medicines are shown to the user to make orders (in Req 3).

1.5) Time Plan:

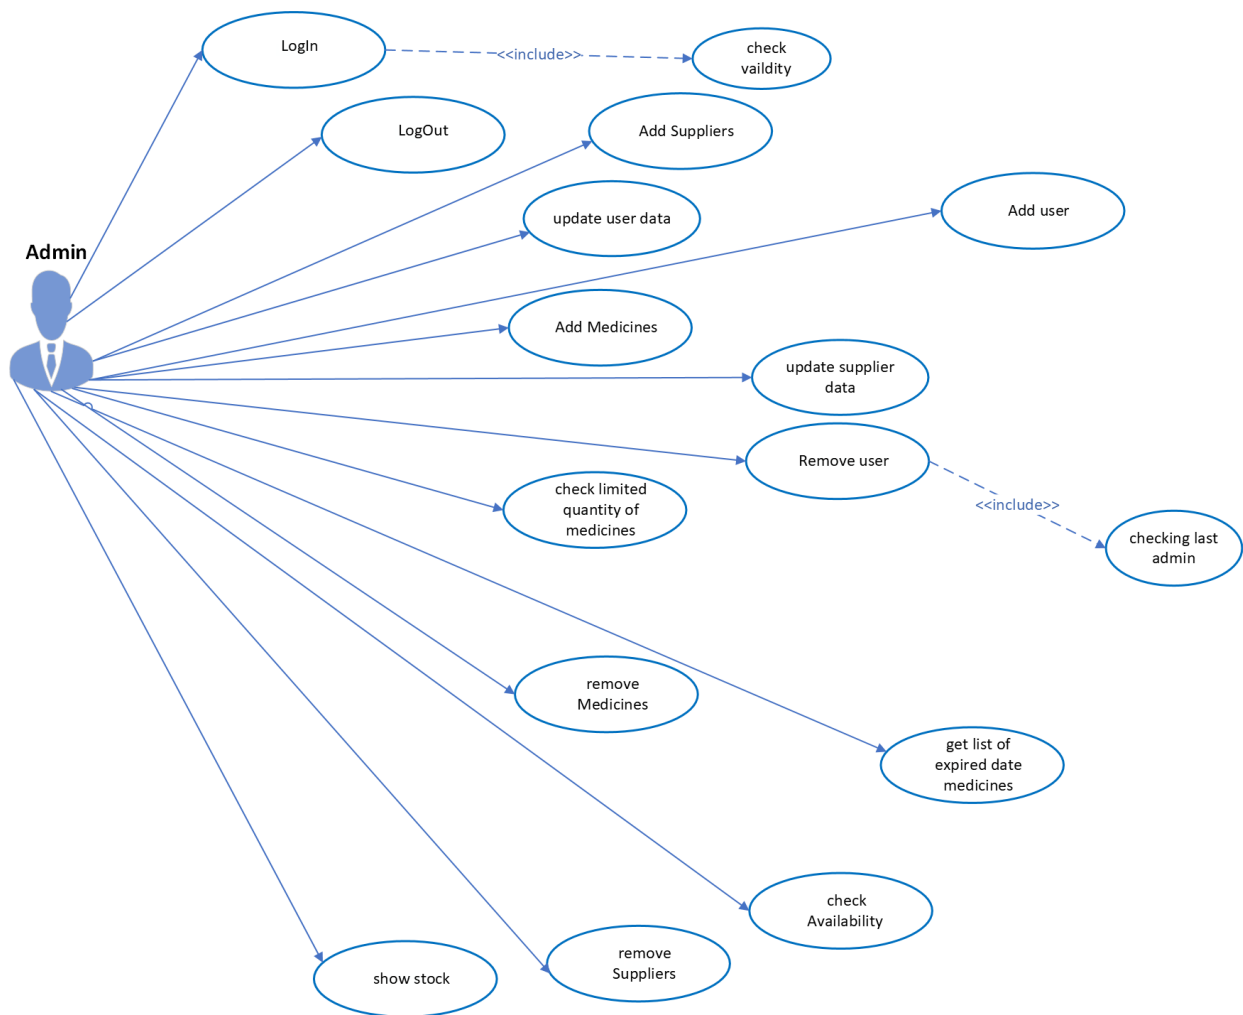

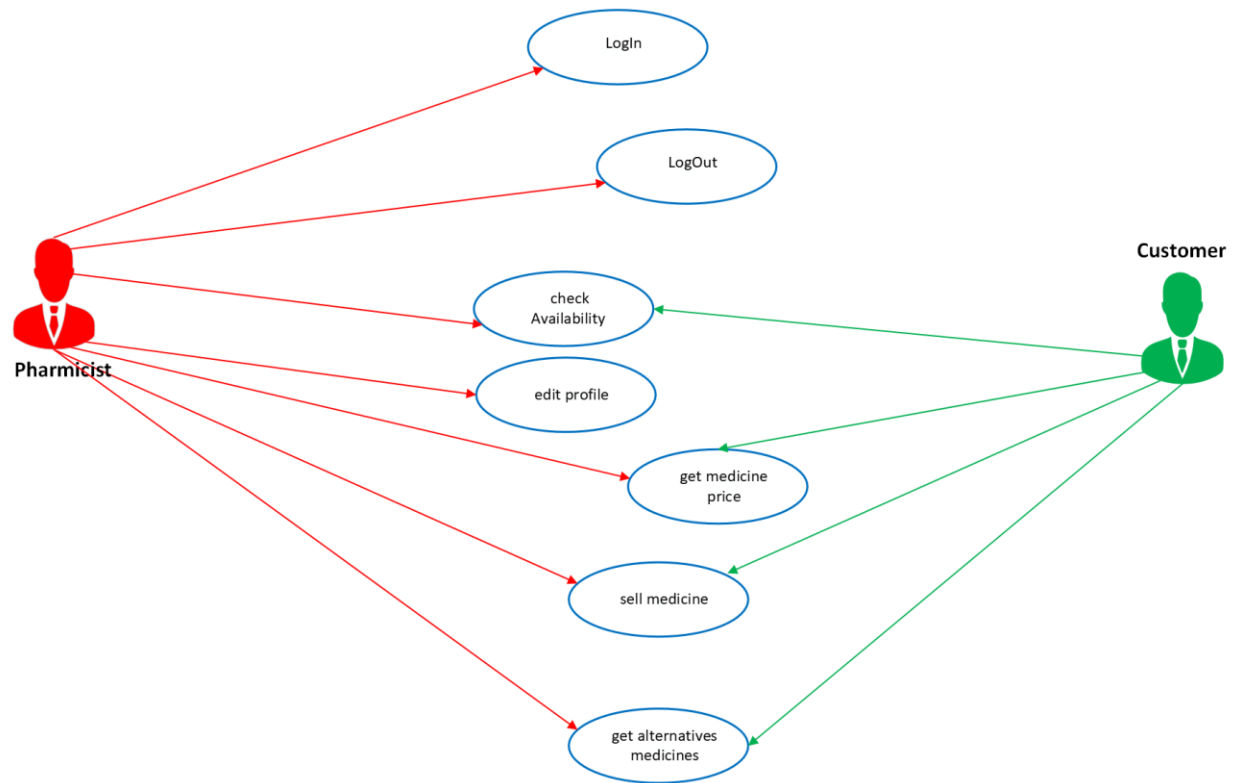

1.6) conclusion:

The software of the pharmacy system requires some tools to be delivered which were shown that they are available, the knowledge and skills required to use them to develop the system are available too, all resources needed are also available and the system can be carried out under the legal and social standards which led to the feasibility of doing this project, that takes the project to the next phase which was stating the functional and non-functional requirements in a clear, consistent, complete way and with no contradictions, then a validation matrices were made and a time plan has been put, all of that leads finally to the ability and intention to develop this system

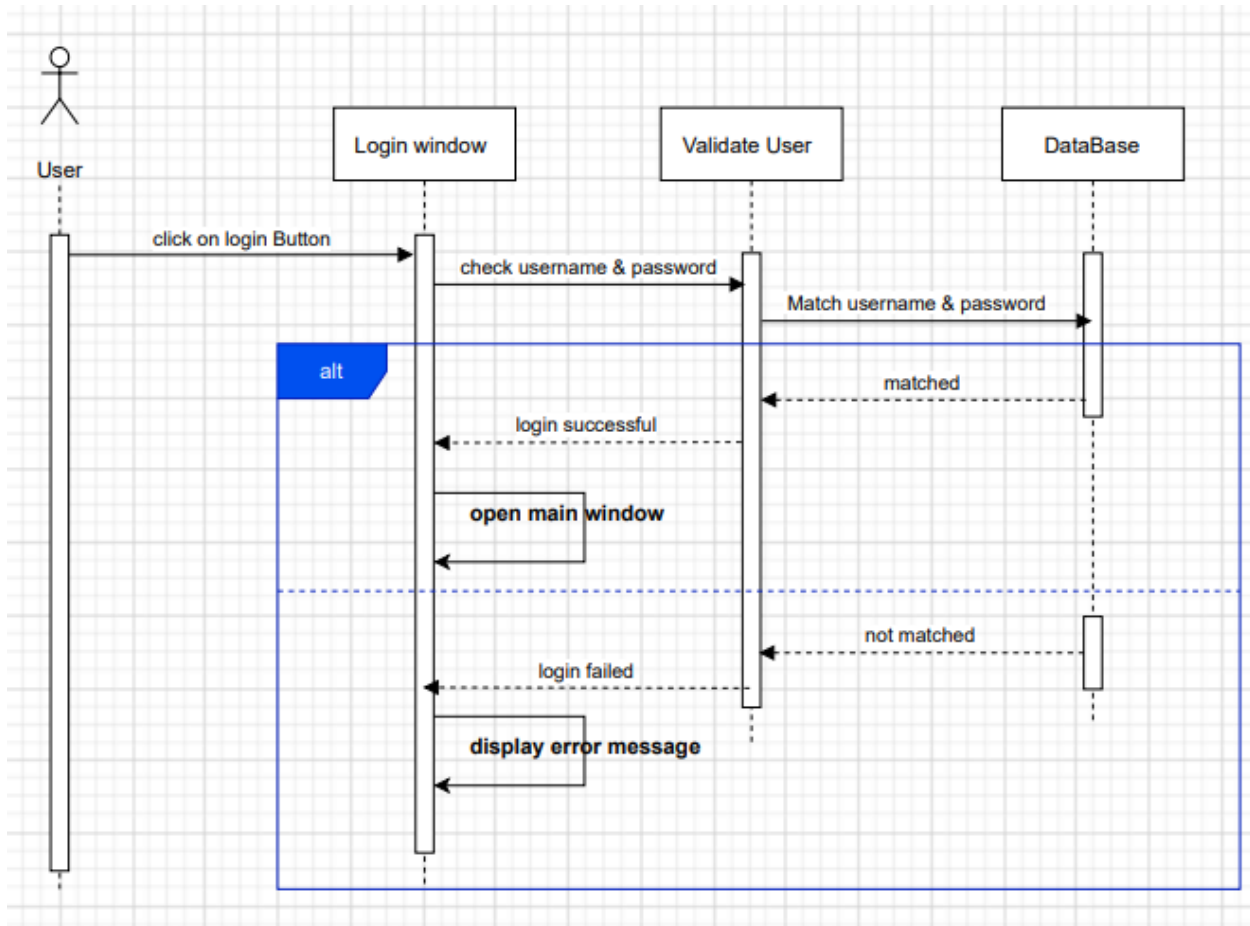

2) Analysis and Design document

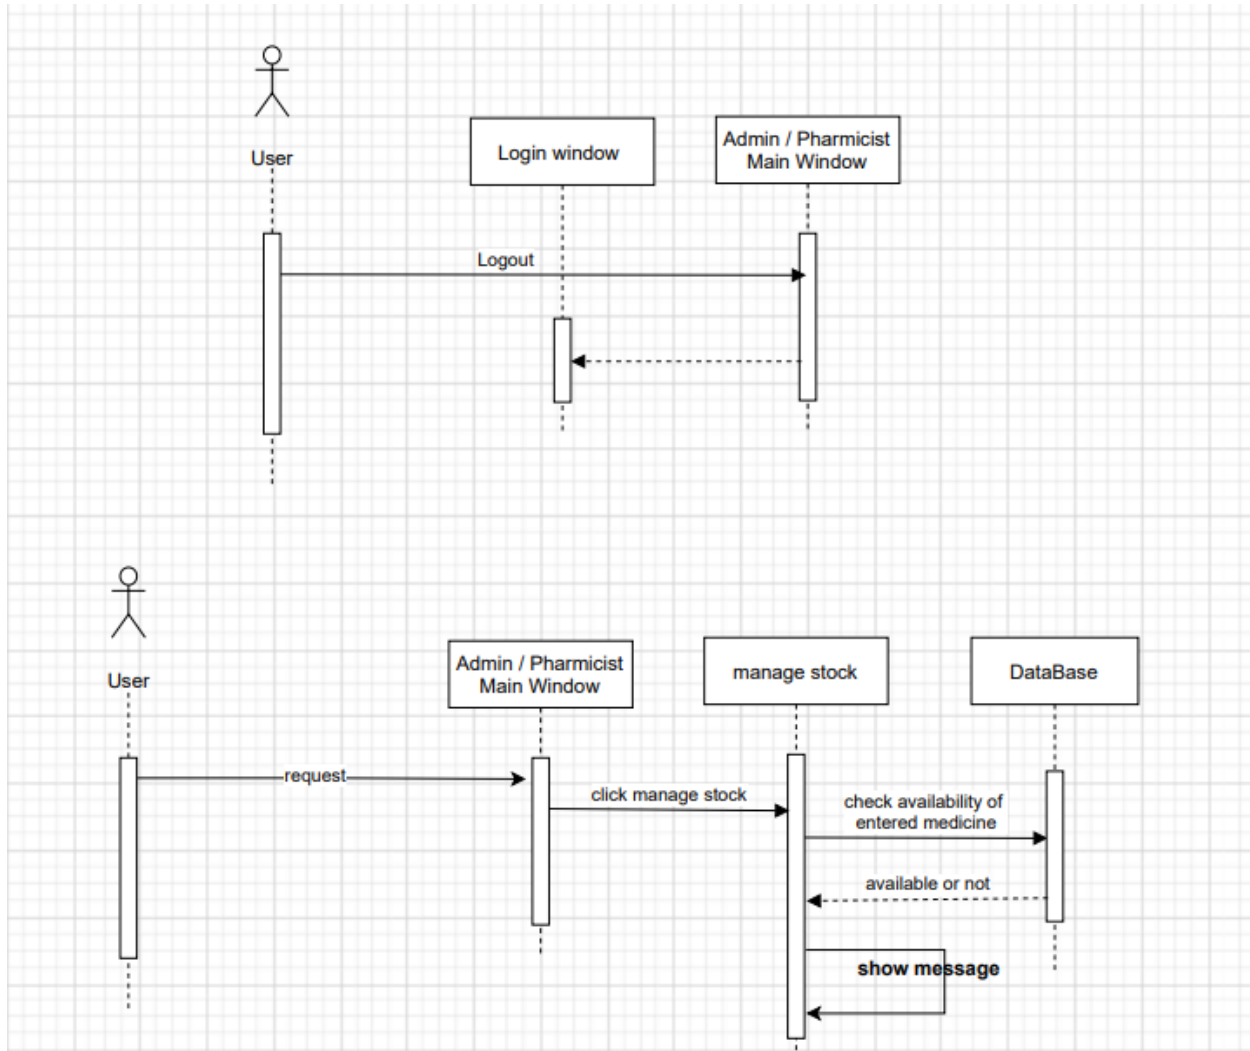

2.1) Use-Case Diagram and the Swimlane Diagram for each Use Case

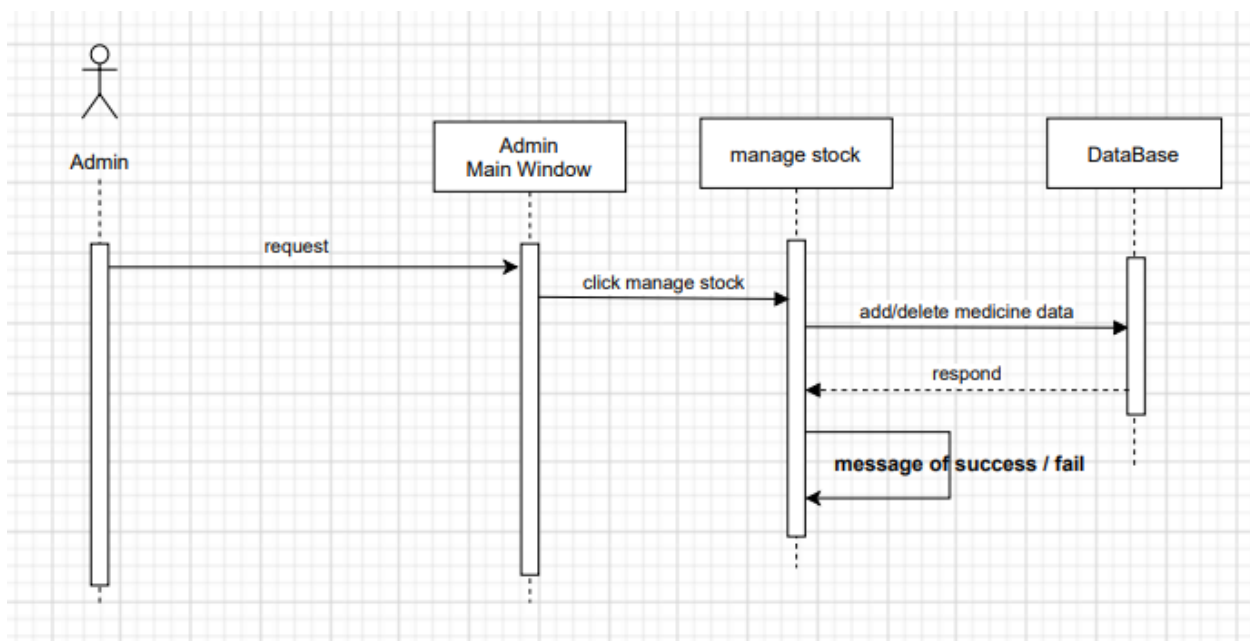

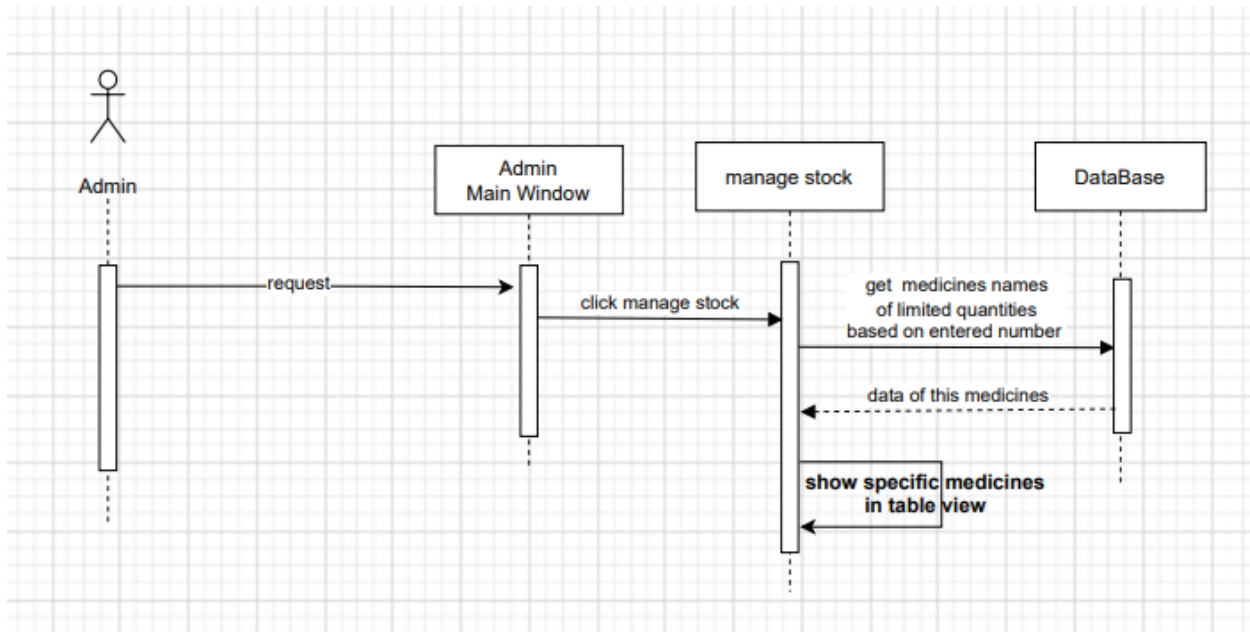

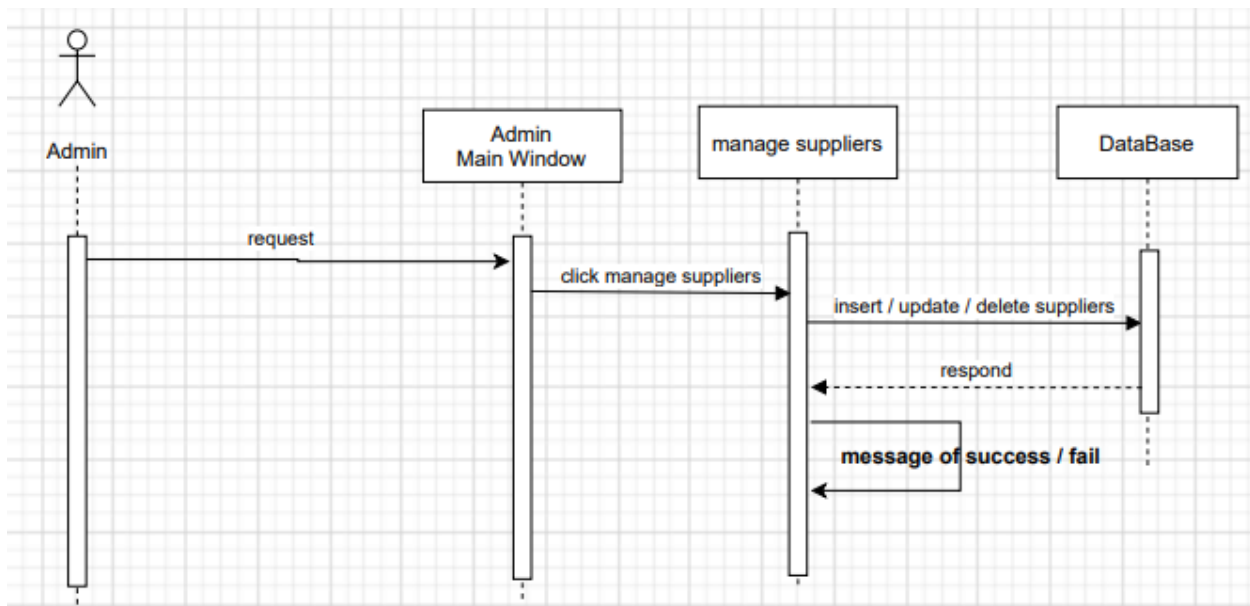

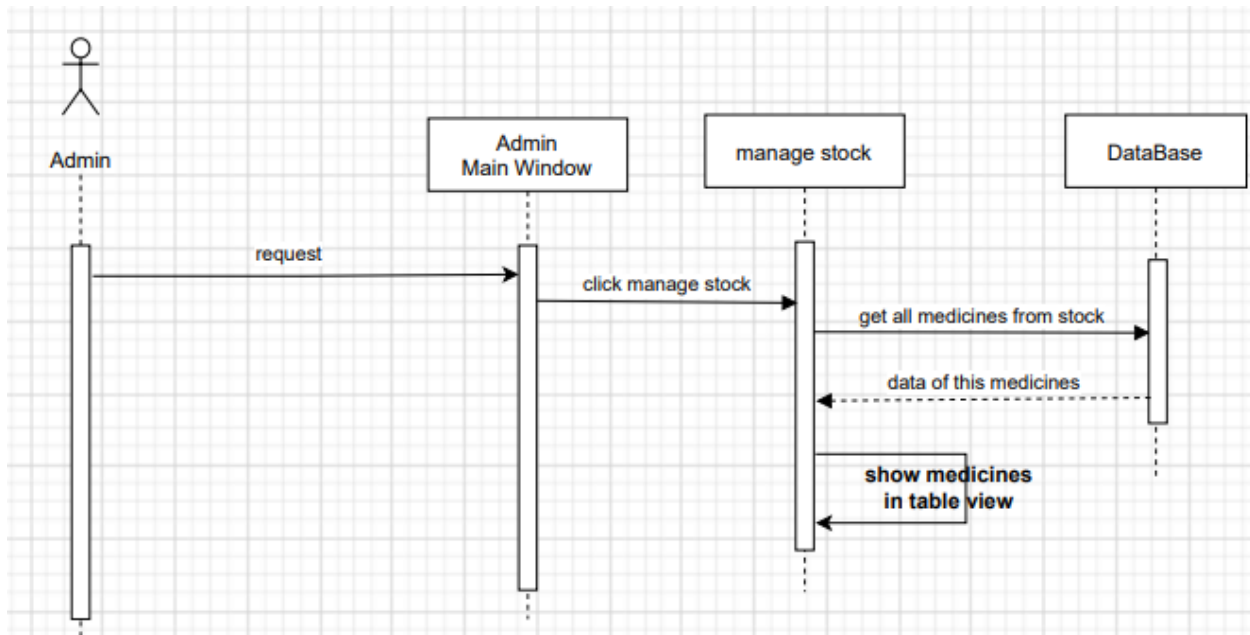

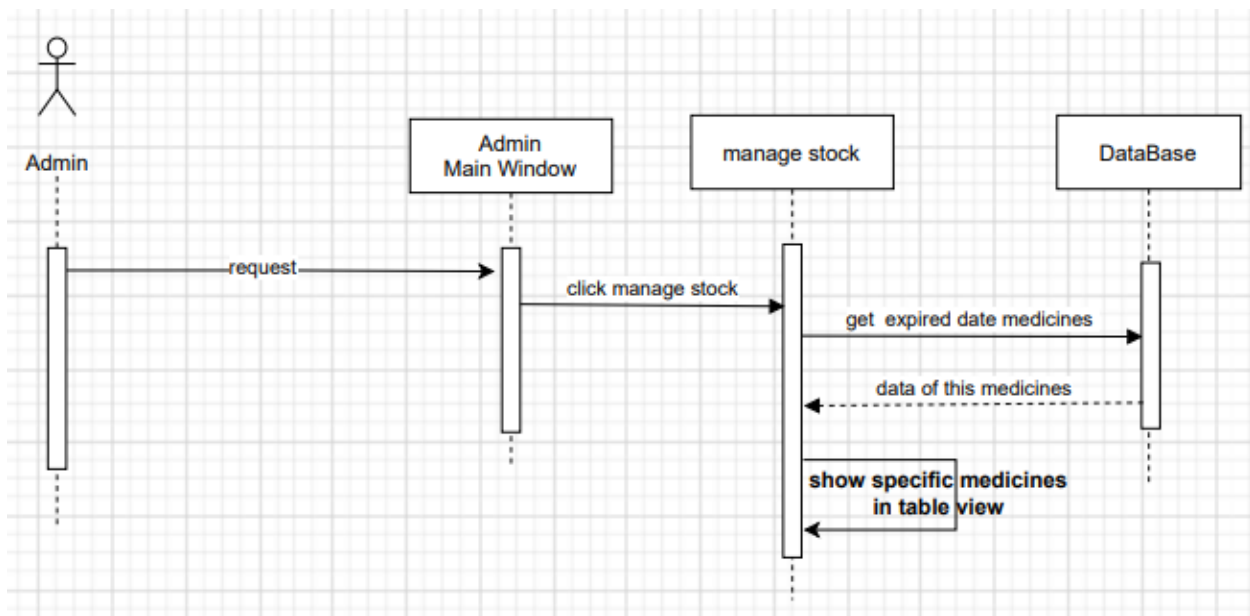

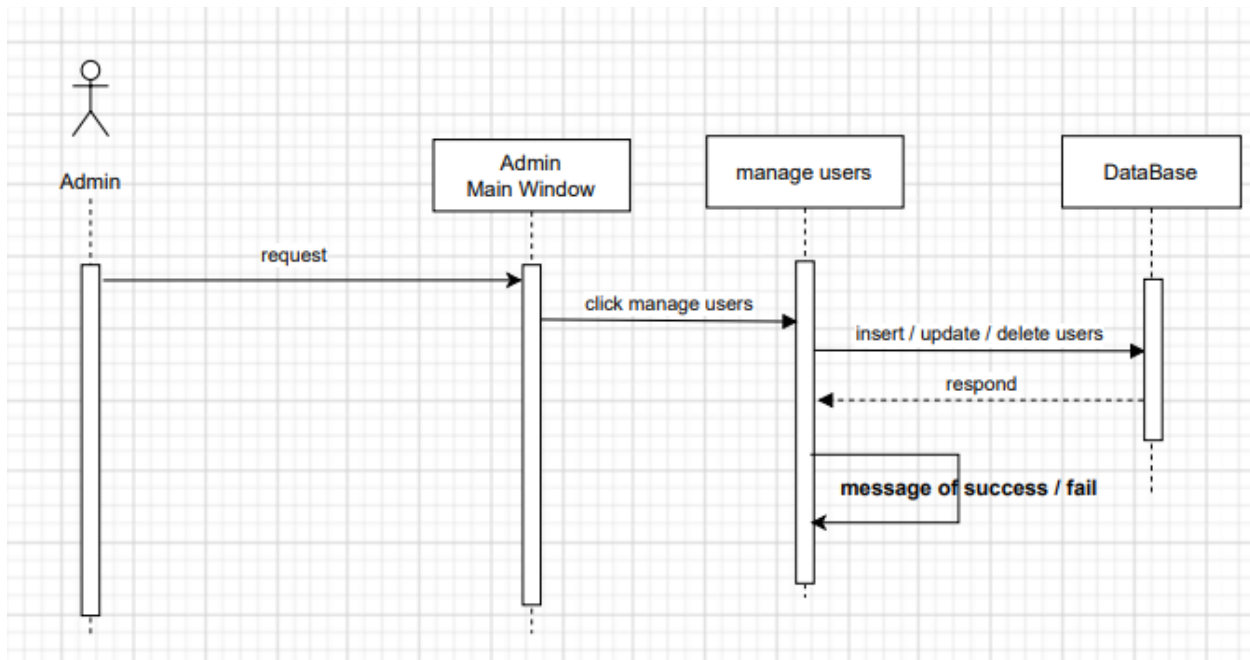

2.2) Interaction Diagrams

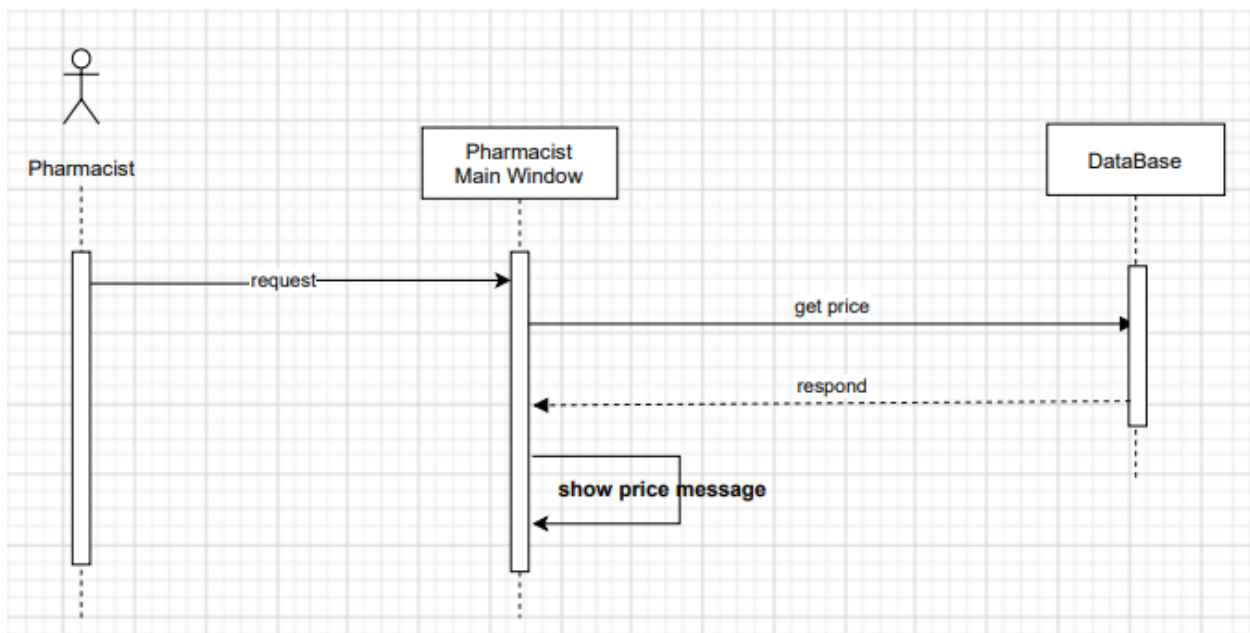

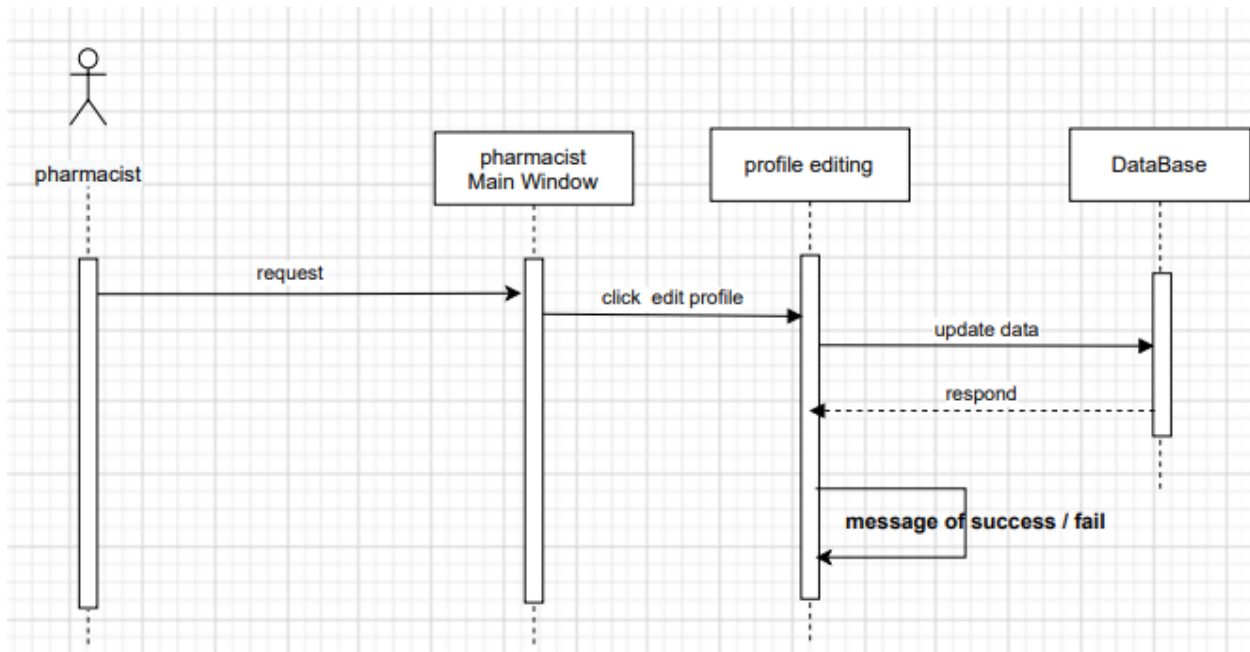

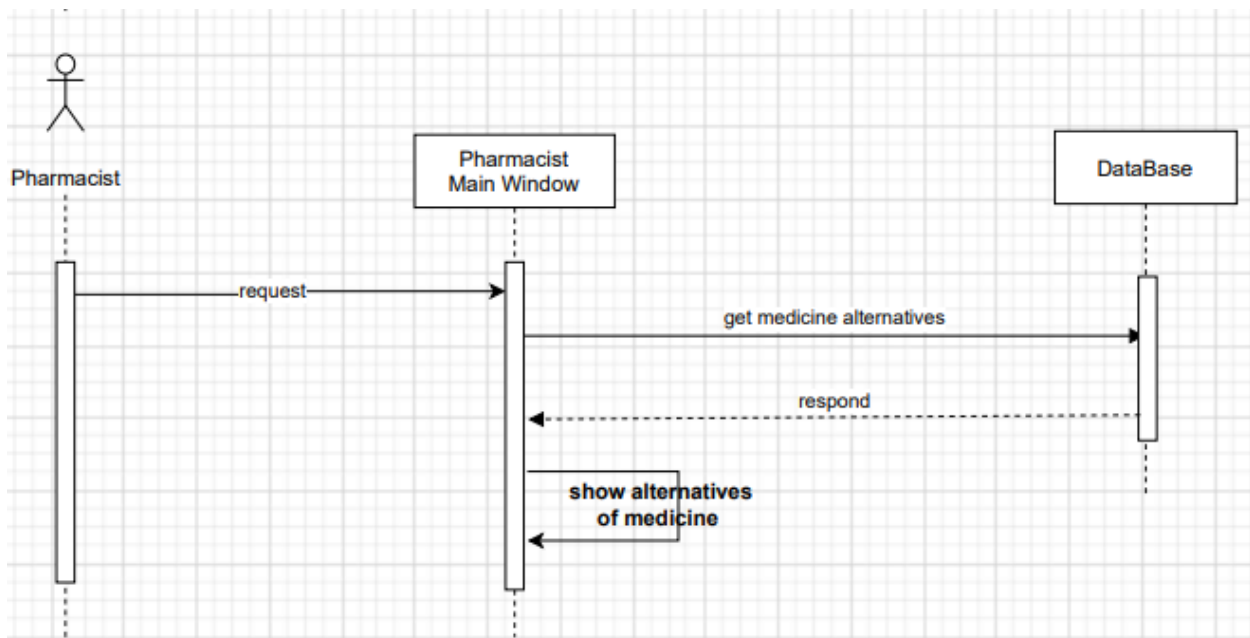

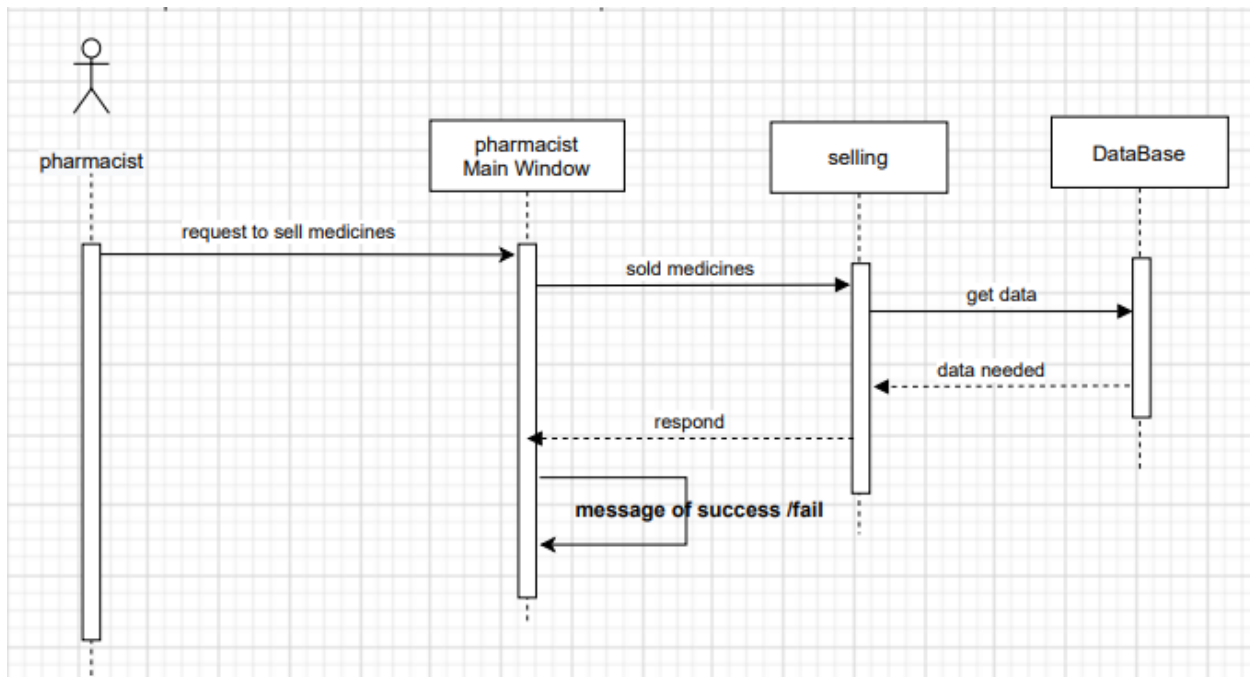

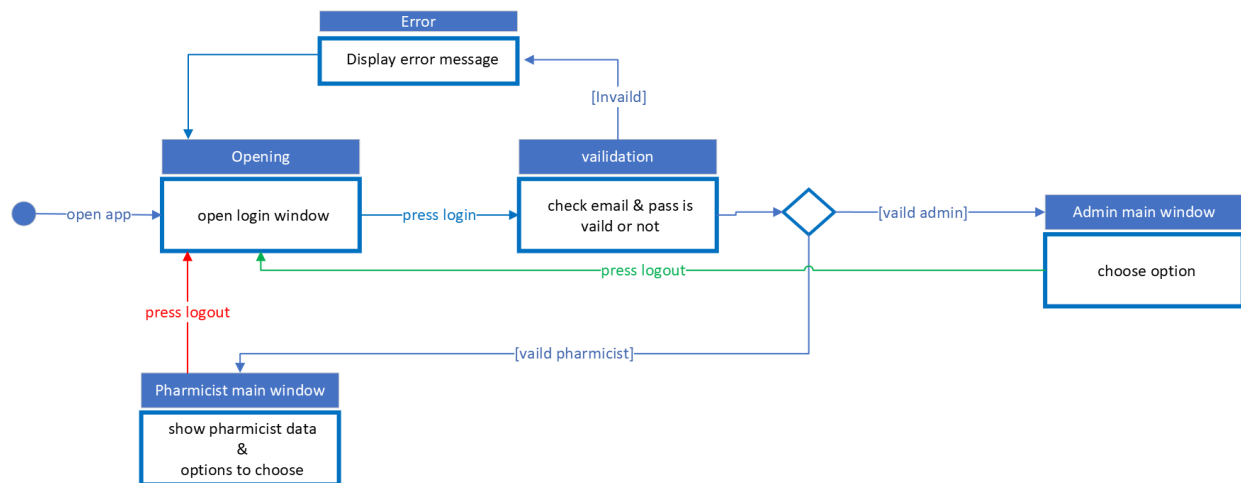

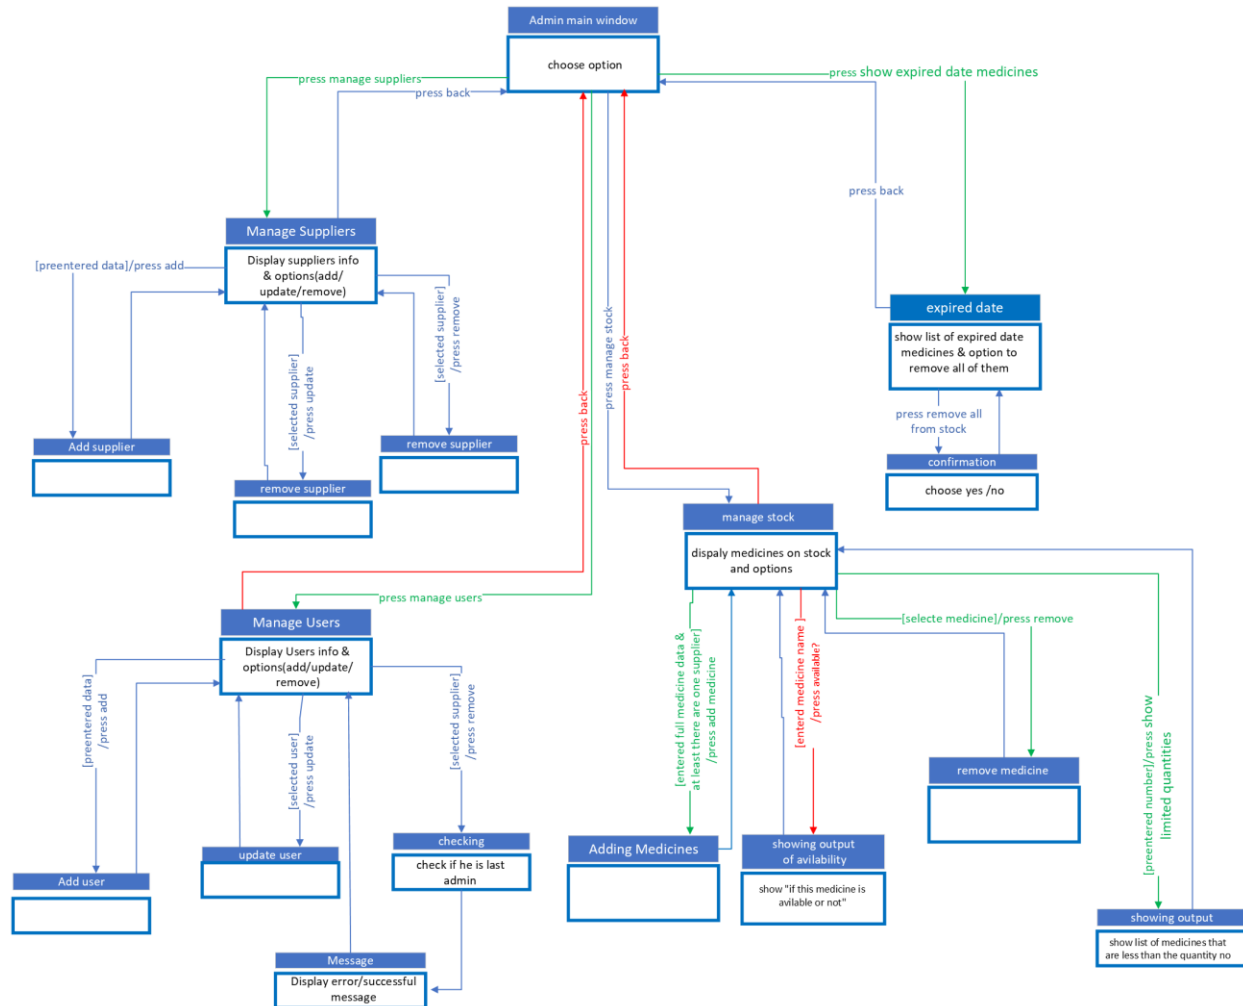

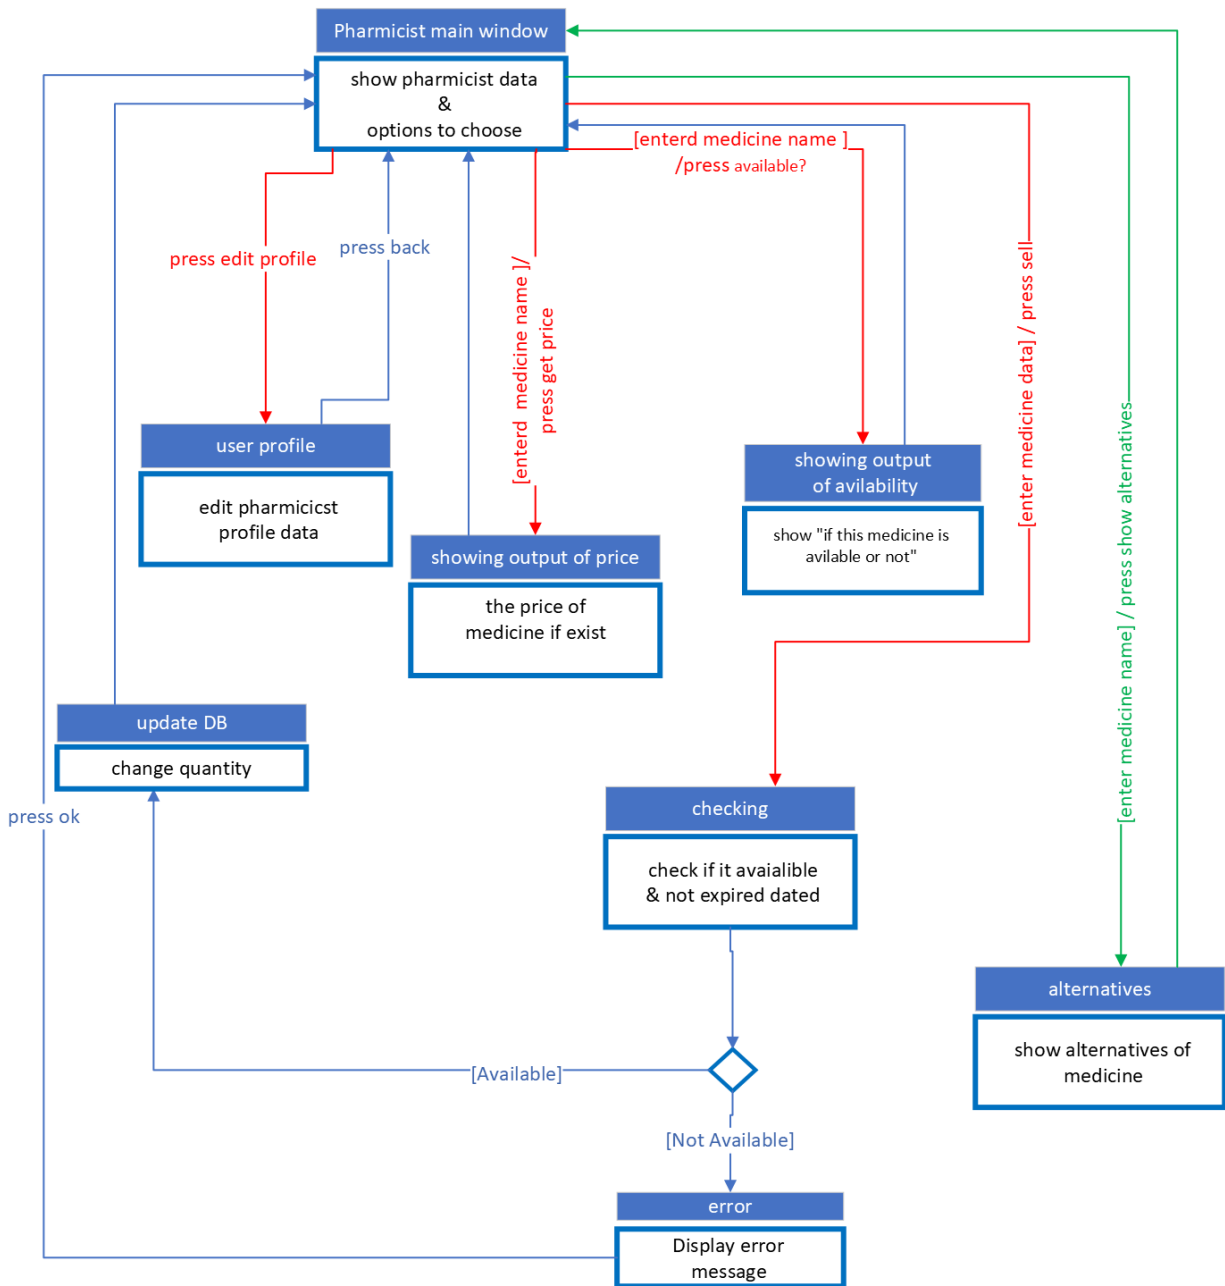

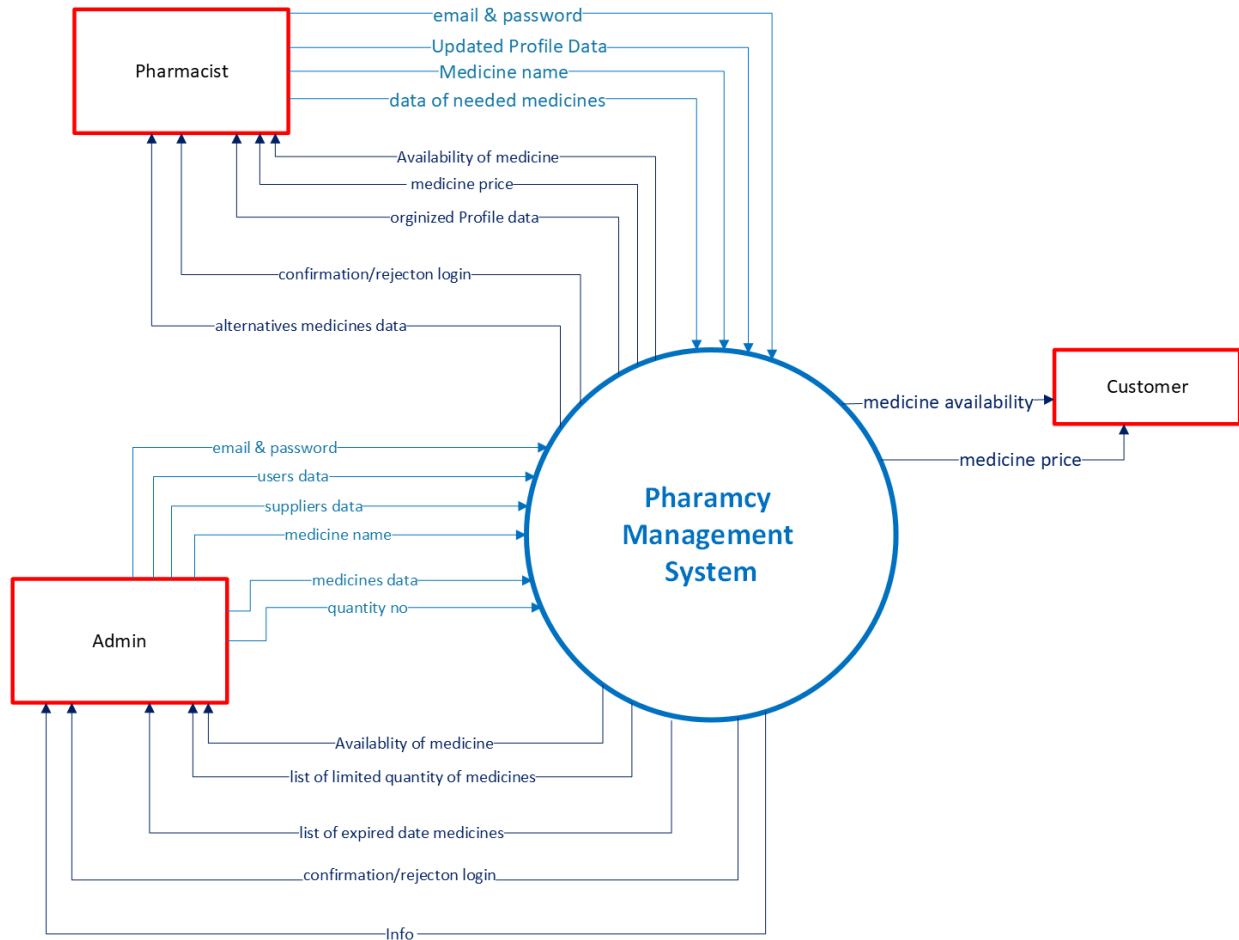

2.3) State Diagrams

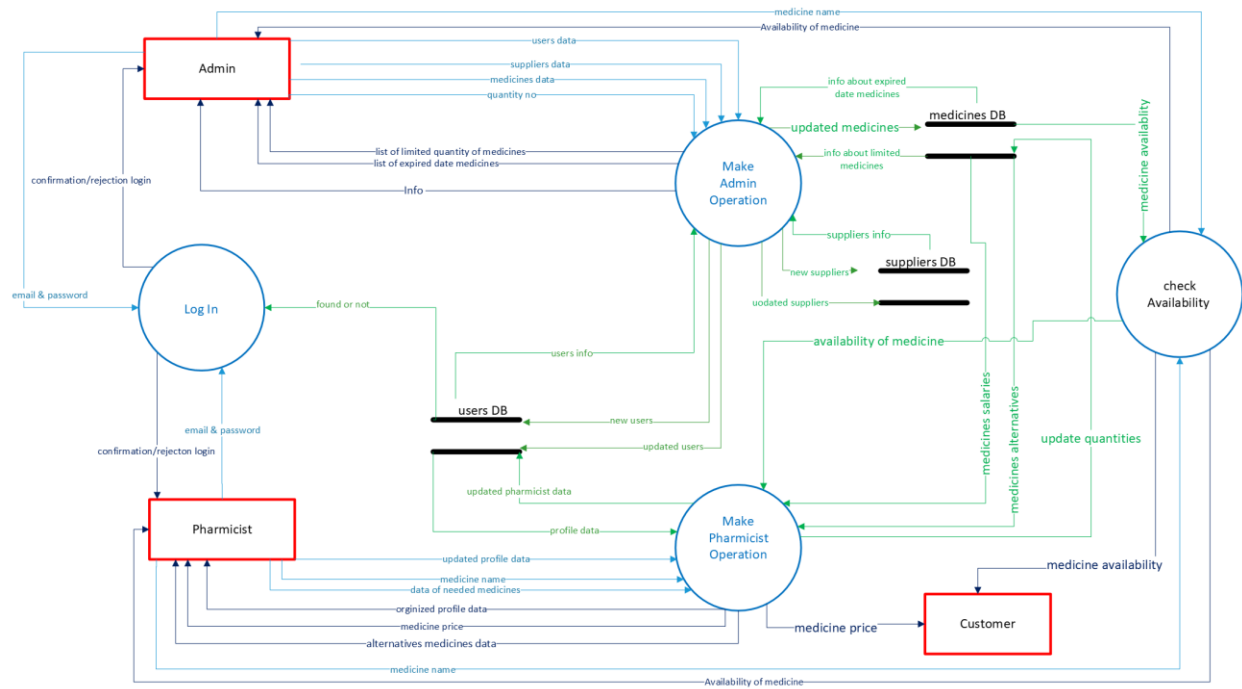

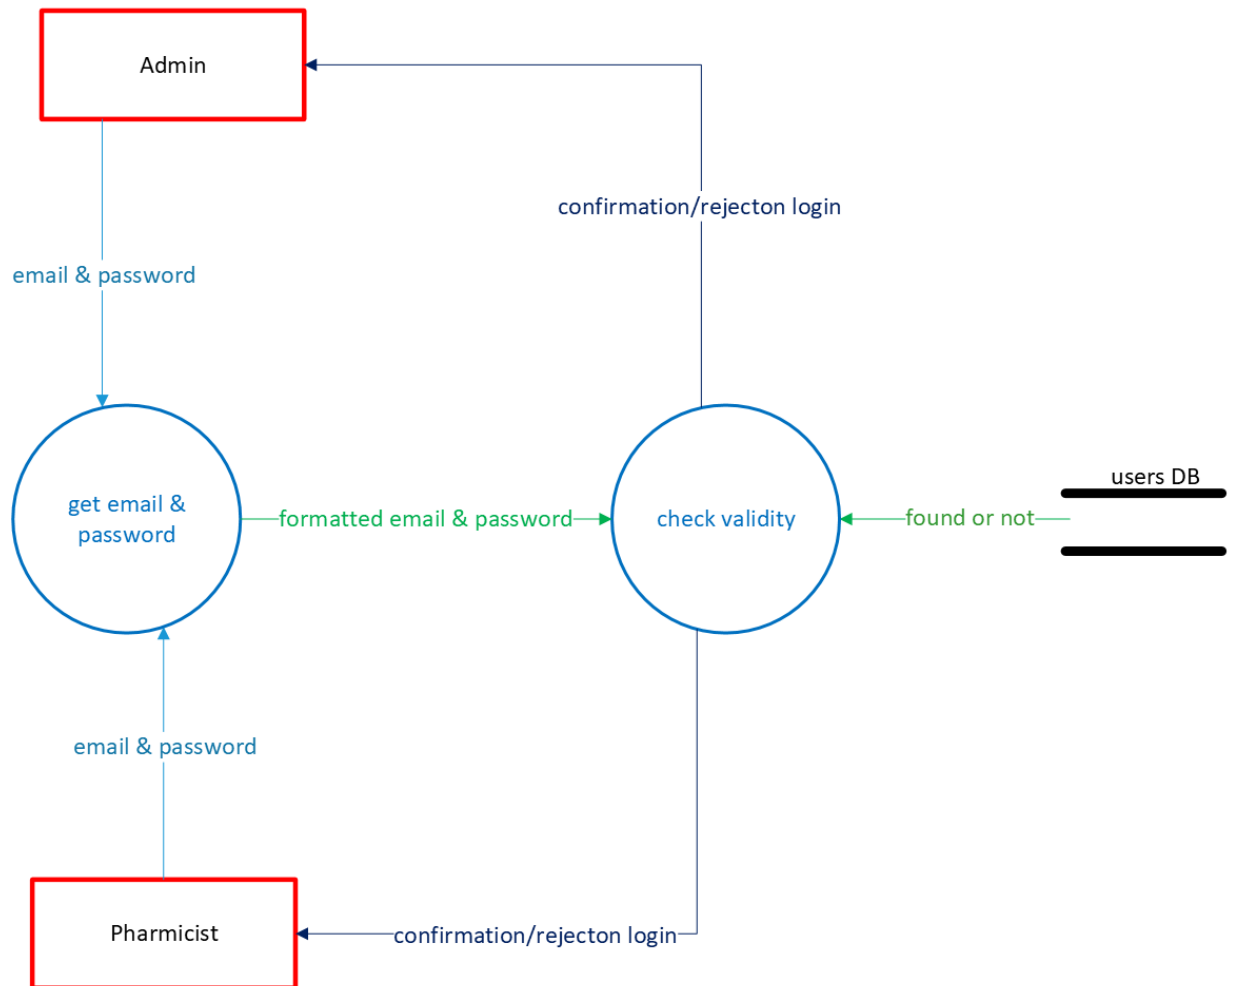

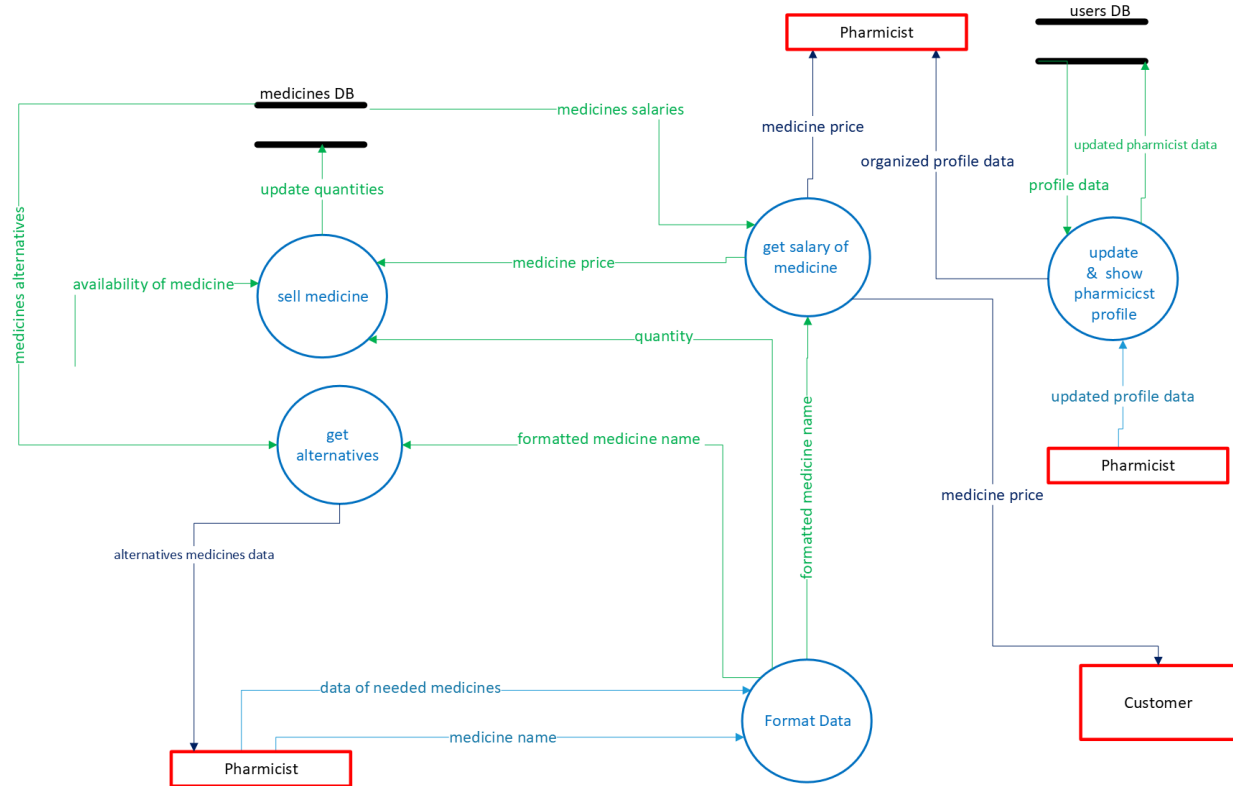

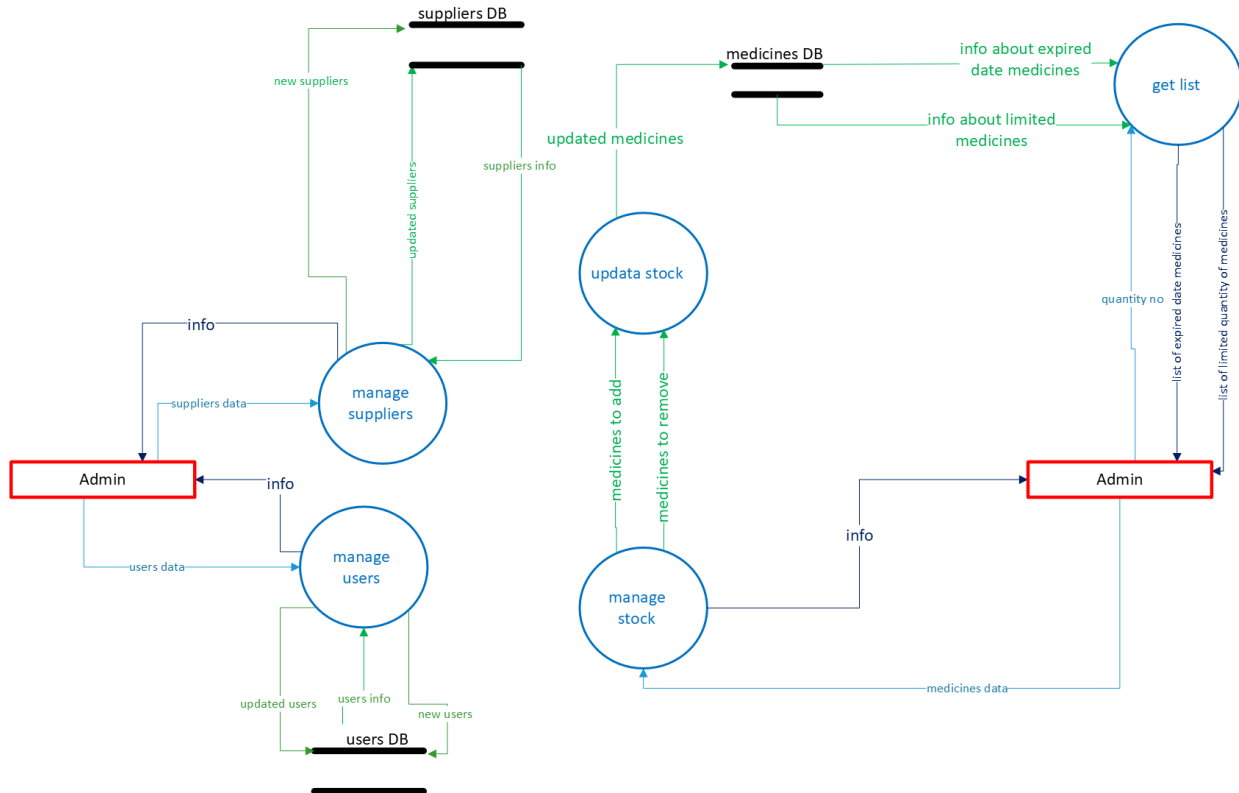

2.4) Data Flow Diagrams

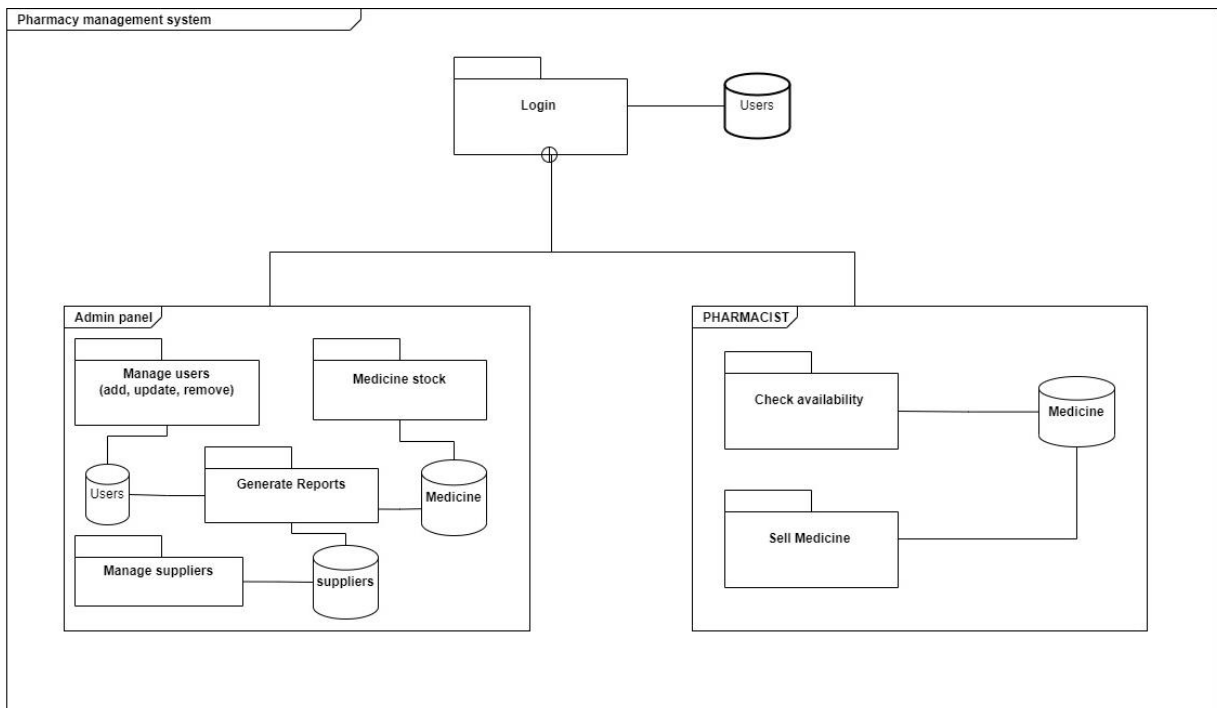

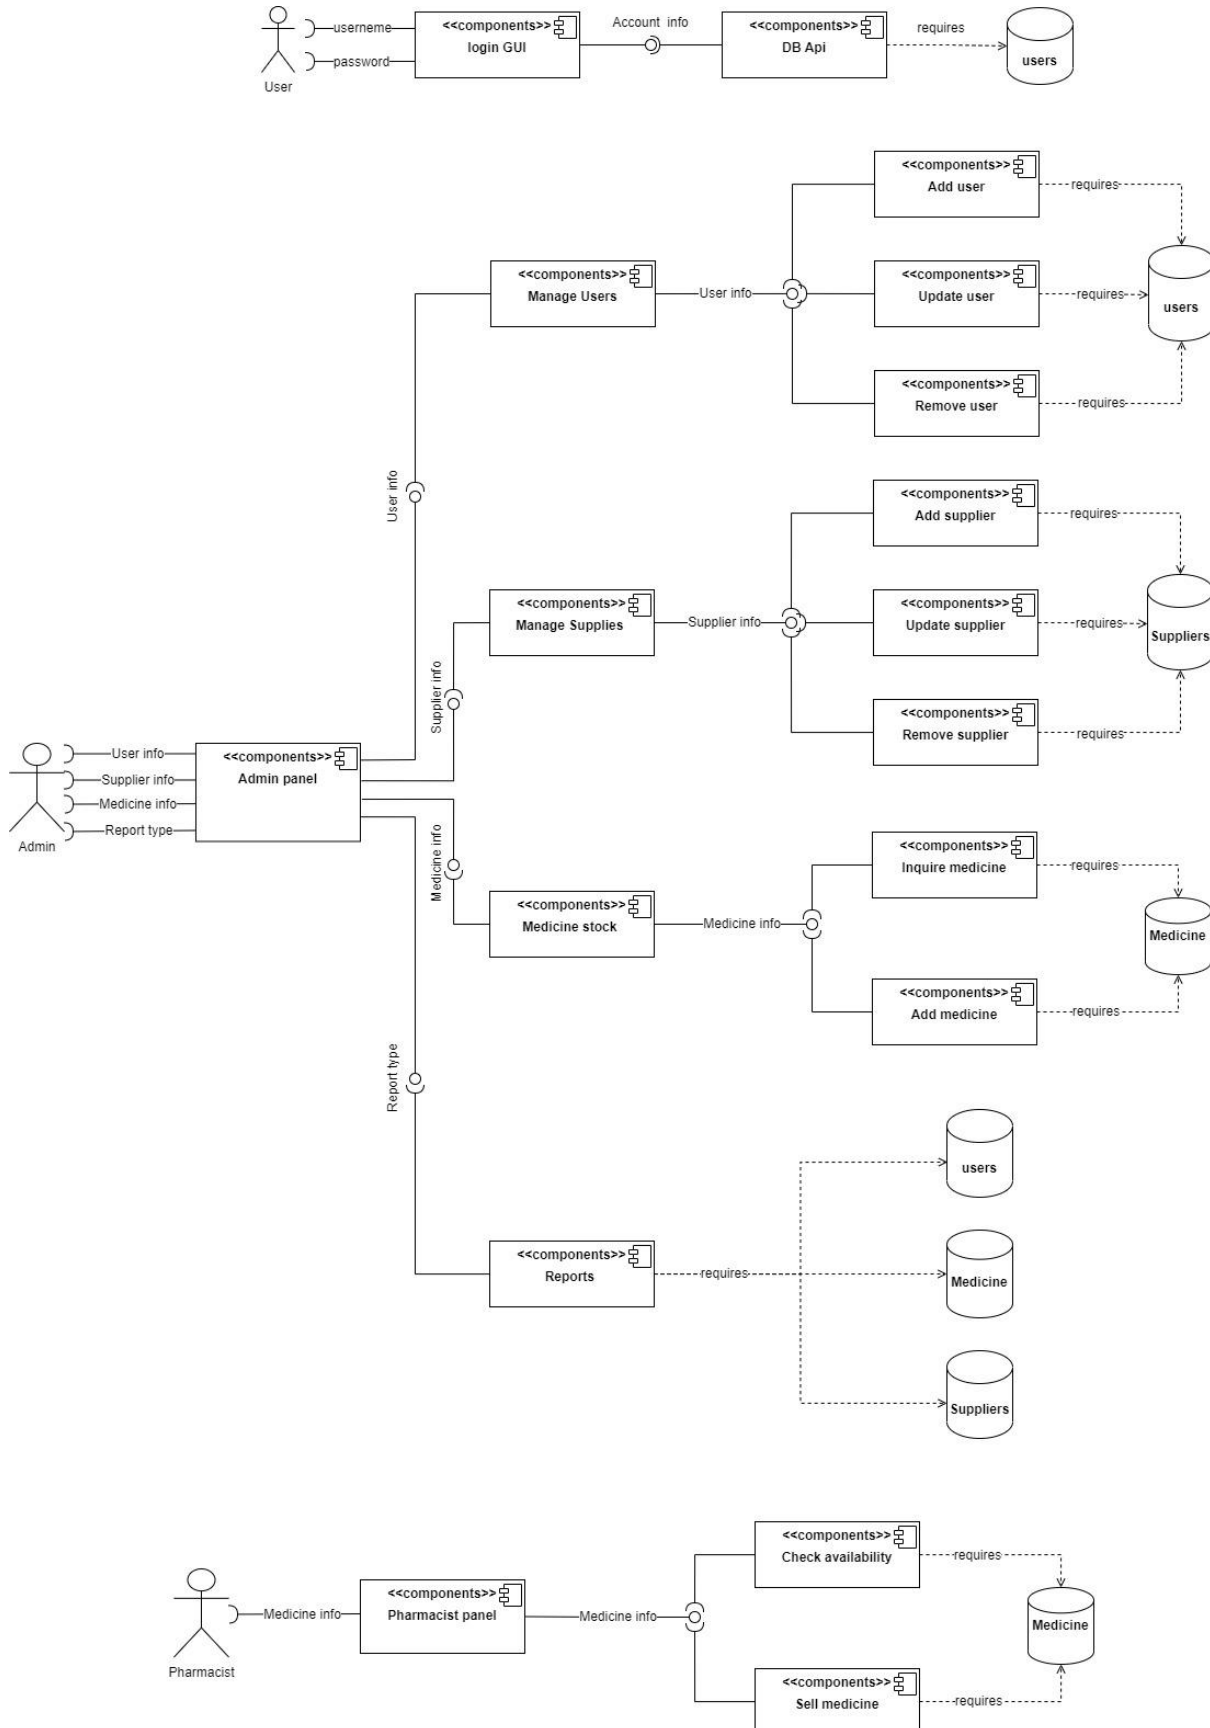

2.5) System Architecture

This is our system architecture diagram in form of a block diagram that shows the major sub-systems in our project and how they interact with each other.
